UC8151

All-in-one driver IC with Timing Controller for Whte/Black/Red Dot-Matrix Micro-Cup ESL

Introduction

The UC8151 is an all-in-one driver with timing controller for ESL. Its output is of 1-bit white/black and 1-bit red resolution per pixel. The timing controller provides control signals for source driver and gate driver.

The DC-DC controller allows it to generate the source output voltage VDH/VDL ($\pm 2.4 \text{V} \sim \pm 11 \text{V}$). The chip also includes an output buffer for the supply of the COM electrode (AC-VCOM or DC-VCOM). The system is configurable through a 3-wire/4-wire (SPI) serial interface.

- (2) Any bits shown here as 0 must be written with a 0. All unused bits should also be set to zero. Device malfunction may occur if this is not done.
- (3) Commands are processed on the 'stop' condition of the interface.
- (4) Registers marked 'W/R' can be read, but the contents are written when the SPI command completes so the contents can be read and altered. The user can subsequently write the register to restore the contents following an SPI read.

Source: First active source = S0 (Fixed); LAST active source = HRES[7:3]*8 - 1

Example: 128x272

Gate: First active gate = G0 (Fixed), LAST active gate = 272 - 1= 271; (VRES[8:0] = 272, G271) LAST active source = 16*8 - 1 = 127; (HRES[7:3]=16, S127)

HOST INTERFACES

UC8151 provides 3-wire/4-wire serial interface for command and display data transferred from the MCU. The serial interface supports 8-bit mode. Data can be input/output by clocks while the chip is active (CSB =LOW). While input, data are written in order from MSB at the clock rising edge. When too many parameters are input, the chip accepts only defined parameters, and ignores undefined ones.

BS	Interface	CSB	DC	SCL	SDA
High	3-wire SPI	Available	Fix to GND	Available	Available
Low	4-wire SPI	Available	Available	Available	Available

3 wire SPI format

Data / Command is recognized with the first bit transferred. Data are transferred in the unit of 9 bits. To prevent malfunction due to noise, it is recommended to set the CSB signal to HIGH every 9 bits. (The serial counter is reset at the rising edge of the CSB signal.)

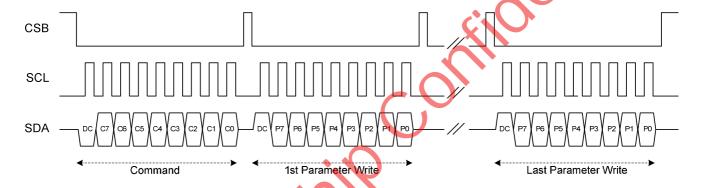

Figure: 3-wire SPI write operation

The MSB bit of data will be output at SDA pin after the 1st SCL falling edge, if the 1st input data at SDA is high. Only in the case of OTP data read, the 1st packet of output data are dummy data.

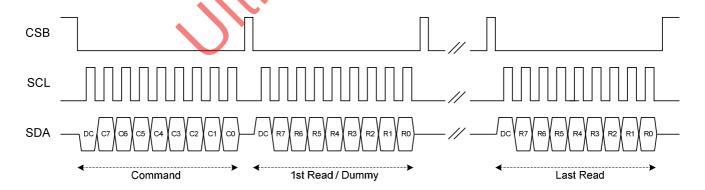

Figure: 3-wire SPI read operation

All-in-one driver IC w/ Timing Controller

4 wire SPI format

Data / Command is recognized with DC pin. Data are transferred in the unit of 8 bits. To prevent malfunction due to noise, it is recommended to set the CSB signal to HIGH every 8 bits. (The serial counter is reset at the rising edge of the CSB signal.)

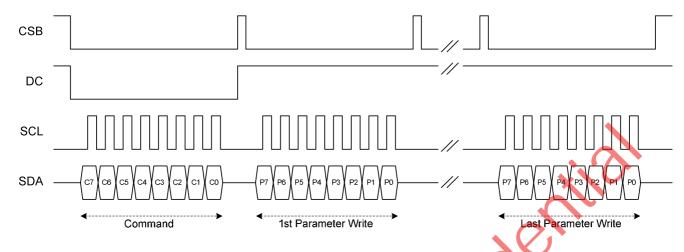

Figure: 4-wire SPI write operation

The MSB bit of data will be output at SDA pin after the CSB falling edge, if DC pin is High. Only in the case of OTP data read, the 1st packet of output data are dummy data.

POWER MANAGEMENT

Power ON/OFF Sequence

- 1. Temperature sensor will be activated automatically for one-time sensing before enabling booster.
- 2. After refreshing display, VCOM will be set to floating automatically.
- 3. In LUT mode (REG_EN=0), the LUT in OTP will be copied to register automatically after the DSP/DRF command.
- 4. After RST_N rising, the waiting time for internal initial processing, greater than 1mS, is necessary. Any commands transmitted to chip during this time will be ignored.

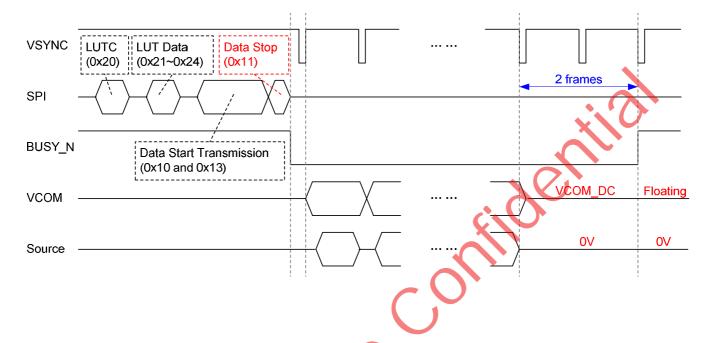

All-in-one driver IC w/ Timing Controller

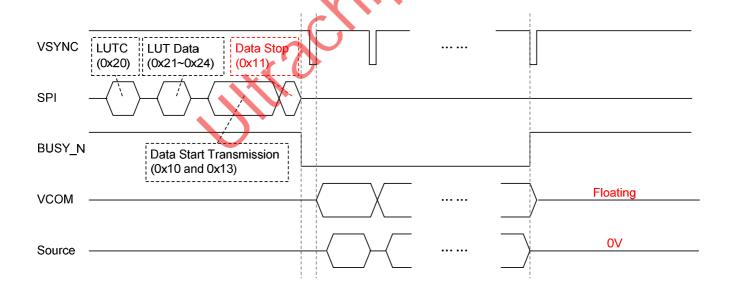

Data Transmission Waveform

Example 1: After 3 cases, the driver will send 2 frame VCOM and data to 0 V.

- 1. All 7 LUT states complete.
- 2. meet the state whose Times to Repeat =0
- 3. meet the state whose all Number of Frames =0

Example2: While level selection in LUT (LUTC only) is "1111_1111b" the driver will float VCOM.

- 3. meet the state whose all Number of Frames = 0

Example2: While level selection in LUT (LUTC only) is "1111_111b", the driver will float VCOM.

BUSY N Signal

Commands, except reading command, are restricted by refreshing display (DRF / DSP) as listed in the following table.

BUSY_N is used to represent the status of internal action. Commands activating internal operation or calculation will cause BUSY_N falling to LOW. After actions compeleted, BUSY_N will return to HIGH.

TEMPERATURE RANGE

The temperature selection mechanism consists of a less-than-or-equal-to operator and 14 temperature boundary settings (TBx) to determine 15 temperature ranges. The sequence of mechanism is from TB0 to TB13, as shown below. If less than 15 tempeature ranges are used, the last TBx must be set to 0x7F to end the mechanism.

Example:

If temperature = -20 °C, LUT-R0 is selected. If temperature = -10 °C, LUT-R1 is selected. If temperature = 0 °C, LUT-R2 is selected. If temperature = 20 °C, LUT-R4 is selected. If temperature = 40 °C, LUT-R5 is selected. If temperature > 40 °C, LUT-R5 is selected.

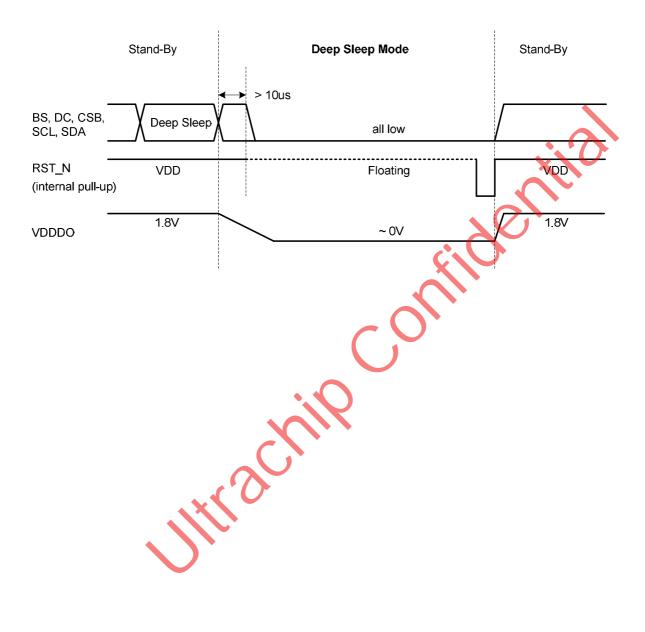

OTP Address	Content	
002h	0xF1	(-15 °C)
003h	0xFB	(-5 °C)
004h	0x00	(0 °C)
005h	0x0A	(10 °C)
006h	0x1E	(30 °C)
007h	0x7F	-

DEEP SLEEP MODE

After deep sleep command (R07H) is transmitted, UC8151 enter "Deep Sleep Mode", and leaves by RST_N falling. In "Deep Sleep Mode", the control signals are recommended tied to 0v to avoid IO leakage current. And the die must be keep away from light which causes photoelectric effect to make internal nodes unstable.

CASCADE APPLICATION CIRCUIT

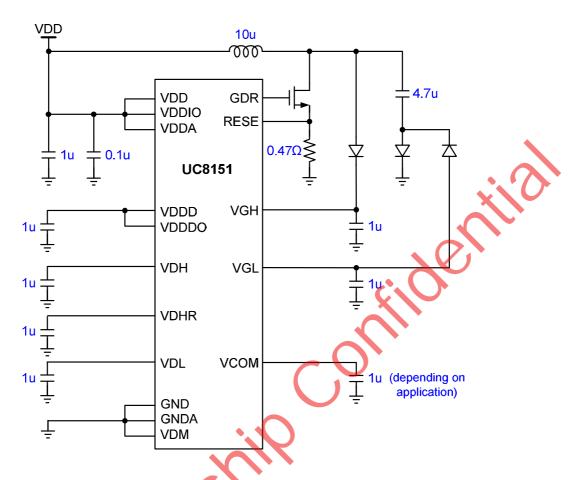

All commands sent to **Master** must be also sent to **Slave** except for data writing (DTM1 and DTM2). The display data must be separated to two parts, one is for **Master** and another is for **Slave**. They are transmitted to **Master** and **Slave** individually by using CSB1 and CSB2.
